LyncStream

CASE STUDIES

Continuous integration and delivery using Microsoft Azure
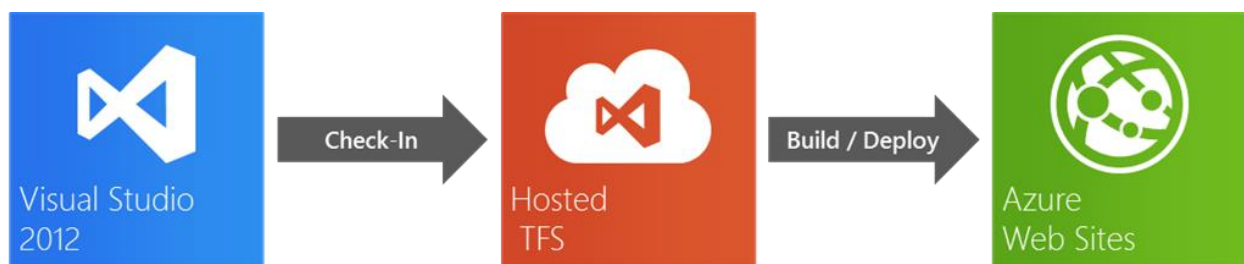

Last Modified December 12 2015

Version 1.0

OVERVIEW

1. BUSINESS NEED

A LyncStream client with a current project budget of over 50 million dollars provides fortune 500 – 1000 companies with a professional wellness program. Projected 15 million or more users, some of these companies include Miller Coors, Johnson & Johnson, and Pfizer. Our client needed the ability to scale during peak business hours, provide multi tenancy for multiple clients and reselling aggregators.

2. SOLUTION

LyncStream used Windows Azure to provide the critical infrastructure that included multiple environments for development, testing and production, TFS and an integrated CI process as well as custom software development.

Windows Azure's auto scaling of production environments at time sensitive windows delivered peak performance for millions of our client's users. Windows Azure traffic manager helped route requests to the closest possible datacenter providing optimal customer experience.

Without Windows Azure, our client would not have been able to stand up the physical environments needed in such a short amount of time and bring their health portal product to market.

With our team of experts, we brought our client the infrastructure and the continuous delivery process needed, leveraging the latest technology from Microsoft Azure. LyncStream was critical in helping our client bring together a large remote team with a short timeline and provide a high quality go to market solution.
